TECHNICAL BULLETIN 4 11/2023

Installation of Penn Aluminum EMT in Specific Applications

Penn Aluminum EMT is a general use product manufactured and certified to UL 797A Standard for Safety for Aluminum Electrical Metallic Tubing (EMT).

Building codes and requirements vary from state-to-state, locale-to-locale, and project-to-project.

It is incumbent upon the architect, general contractor, sub-contractor, and/or installer to ensure that the EMT is appropriate for a specific application and to determine whether there are additional requirements that might be necessary for the use of EMT in a specific application.

Where particular application issues or questions arise, Penn Aluminum is available and willing to assist your efforts to develop solutions as a part of our commitment to provide a high level of customer service. This assistance may include samples for testing purposes and/or information regarding the aluminum alloy we extrude including chemical composition and physical properties.

Penn Aluminum recently became aware of one such application specific requirement involving a hospital construction project, where, at least in some states or municipalities and depending on the project, additional steps may be required when installing EMT through a firewall. As with any project, it may be necessary to consult with construction and/or fire protection system experts to determine what, if any, additional steps are necessary when using aluminum EMT in such applications.

Penn Aluminum takes pride in the quality of our products and our dedication to customer service.

Please visit our website at www.pennconduit.com for additional information regarding our products, or email conduitsales@pennaluminum.com with any questions you may have.
